Assignment 2

Marco Donnarumma s318922
Federico Castriotta s319872
Lisa Cangialosi s314809
Luca Filippetti s303392

Intro

(1.a Project title and team members)

Gym Tonic

Marco Donnarumma
Federico Castriotta
Lisa Cangialosi
Luca Filippetti

(1.b Value proposition)

“Get toned up with fun”

Intro

(1.c - Problem/solution overview)

Our focus area centered on individuals who held a gym membership for under six months (categorized as beginners) and were aged between 18 and 30. Through multiple interviews, we gathered valuable insights that encapsulated **three deep user needs:**

- “The user needs a way to learn proper exercise technique in order to avoid injuries”

- “Needs to learn how to schedule the workout plan for a specified amount of time (weeks, months)”

- “The user needs a way to feel rewarded after training session to find consistency over time.”

To address them, we brainstormed potential solutions. **Our proposed approach involves interactive multimedia content** designed to demonstrate correct exercise techniques and highlight the involved muscle groups. We believe this solution effectively targets the first user need within our defined domain, aligning with the lack of experience among our target audience.

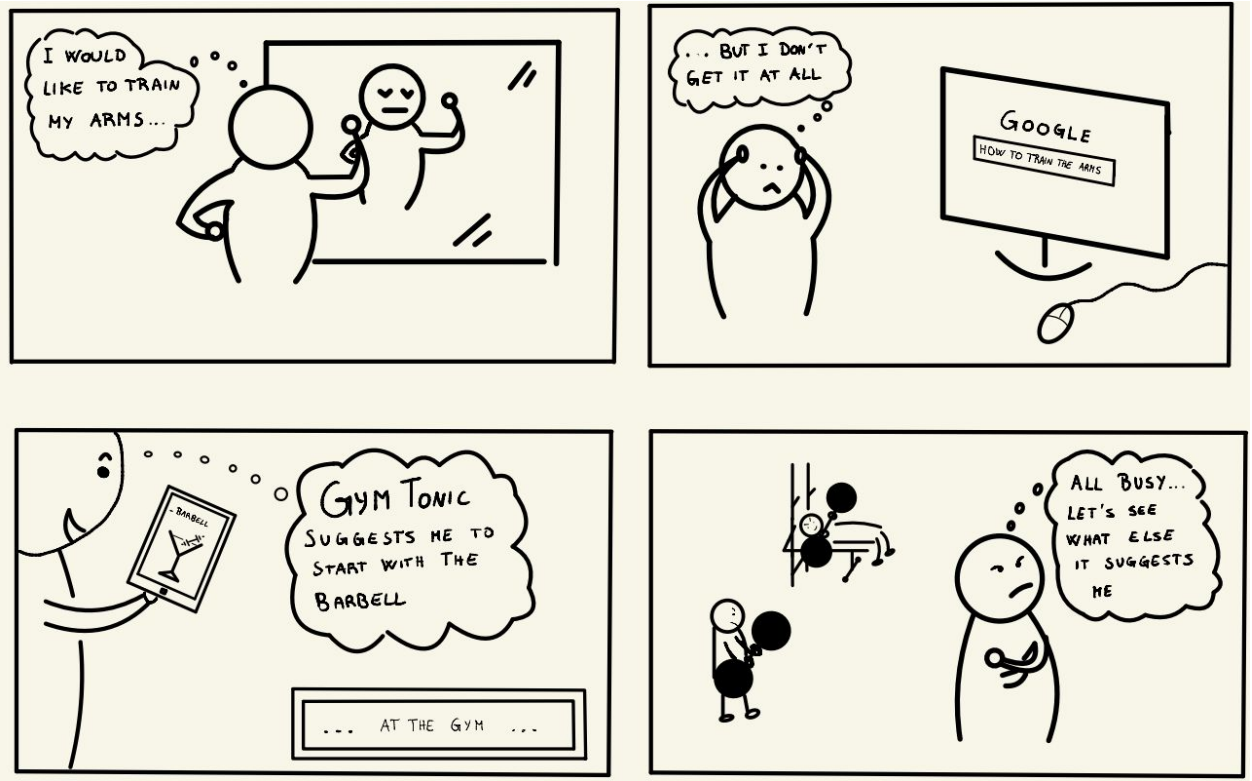
Tasks and Storyboard

(2.a - List of the simple, moderate and complex tasks)

- **(Simple)** Learn how to perform an exercise
- **(Moderate)** Replace an exercise with another one related to the same muscle group
- **(Complex)** Reach a certified level

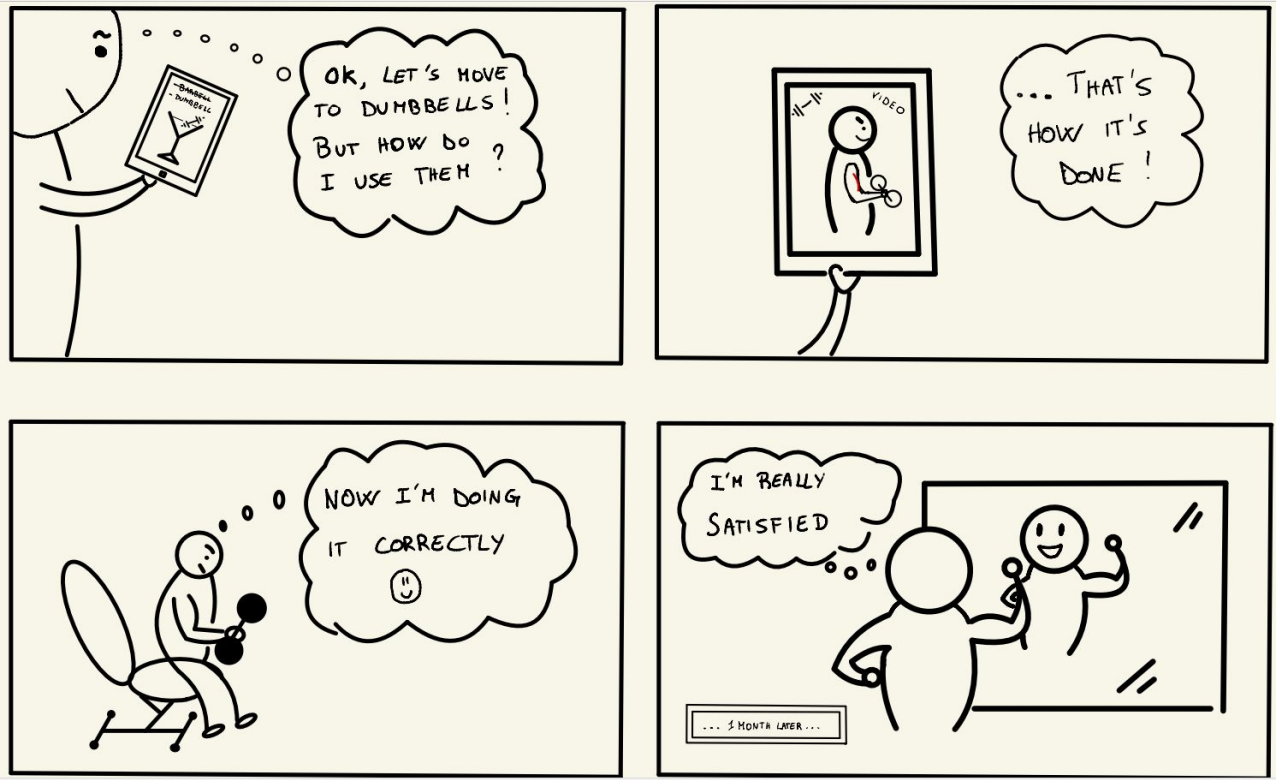
Tasks and Storyboard

(2.b Storyboard: why you chose it, which are its strengths and weaknesses, and how well it achieves the identified goal/user need)



Tasks and Storyboard

(2.b Storyboard: why you chose it, which are its strengths and weaknesses, and how well it achieves the identified goal/user need)



Tasks and Storyboard

(2.b Storyboard: why you chose it, which are its strengths and weaknesses, and how well it achieves the identified goal/user need)

We developed a **storyboard** with the intent to address **two specific tasks:**

- **(Simple)** Learn how to perform an exercise
- **(Moderate)** Replace an exercise with another one related to the same muscle group

Considering our primary objective of assisting users in mastering correct exercise techniques to prevent injuries, we have identified a range of strengths and weaknesses within our proposed storyboard.

Tasks and Storyboard

(2.b Storyboard: why you chose it, which are its strengths and weaknesses, and how well it achieves the identified goal/user need)

Strengths:

- It effectively addresses both the simple and moderate tasks that were defined
- It skillfully presents a well-structured and coherent series of events or actions, guiding the viewer through a clear and logical flow.
- It communicates information concisely and efficiently, avoiding unnecessary details or confusion

Weaknesses:

- In one panel, the user expresses, "Now I'm doing it correctly," yet there's no direct feedback from the application verifying the accuracy of their statement.

In summary, we believe our proposed solution effectively meets the intended objective.

Modalities exploration

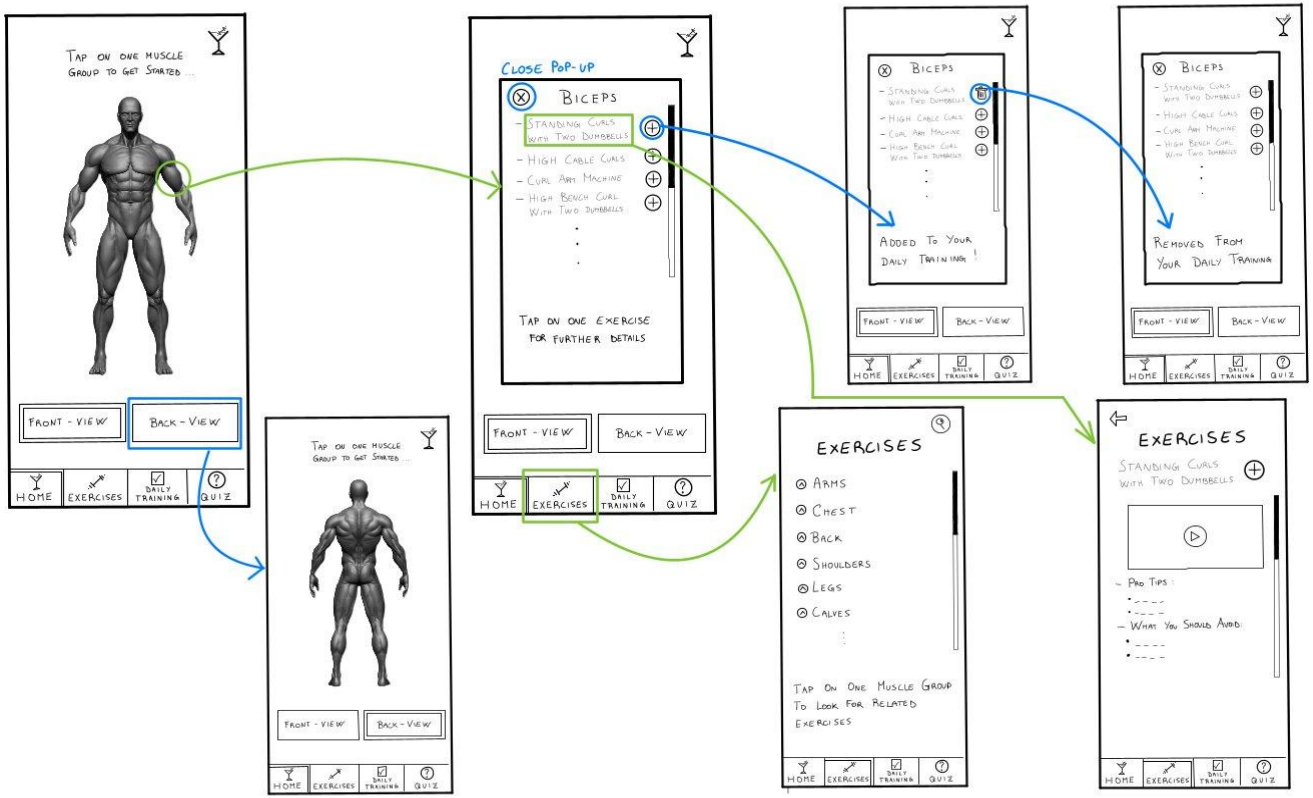
(3.a Overview of the alternatives you considered - 3.b Present the two selected alternatives and the motivation)

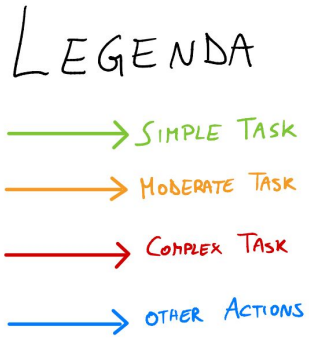
To make our solution work, we thought about different devices we could use, such as smartphone, tablet, computer, smartwatch.

Eventually, we picked the **smartphone and smartwatch.** We chose these because we wanted people to be able to use our solution easily while they're at the gym. These devices are usually taken along to the gym, so it's more convenient for people to use our solution there.

Paper prototype #1

(4.a Include the high-level flow of the "screens" of your prototype,
4.b How does it connect to the storyboard and the three tasks ?)





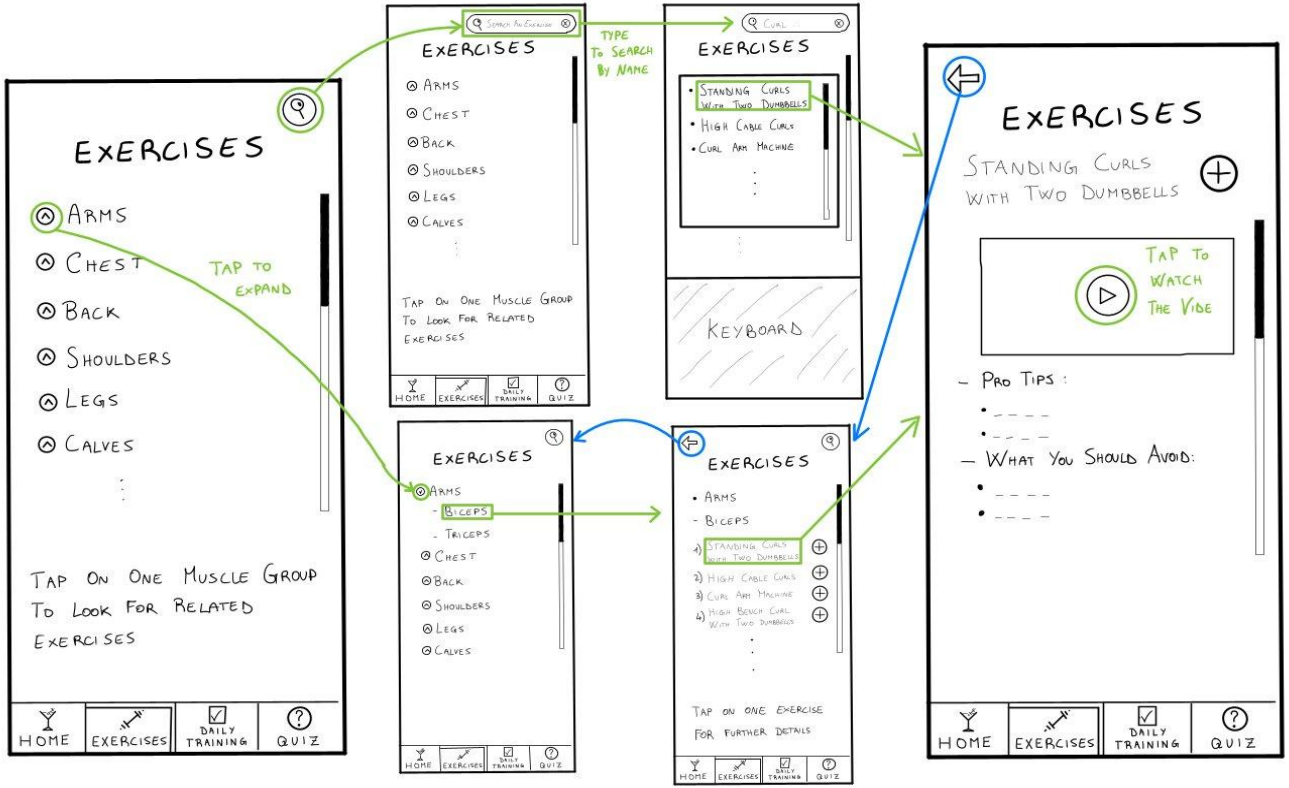
Simple task:
The user can access the information about exercises through the interaction with an anatomical dummy. By tapping on a muscle group he can look into the details of an exercise, watch related videos and read pro tips. Moreover, he can add the exercise to his daily training plan.

Paper prototype #1

(4.a Include the high-level flow of the "screens" of your prototype,
4.b How does it connect to the storyboard and the three tasks ?)

Simple task:
The user has two other ways to access the details about a specific exercise:

- via text search,
- through the "Exercises" menu, which is divided into muscle groups

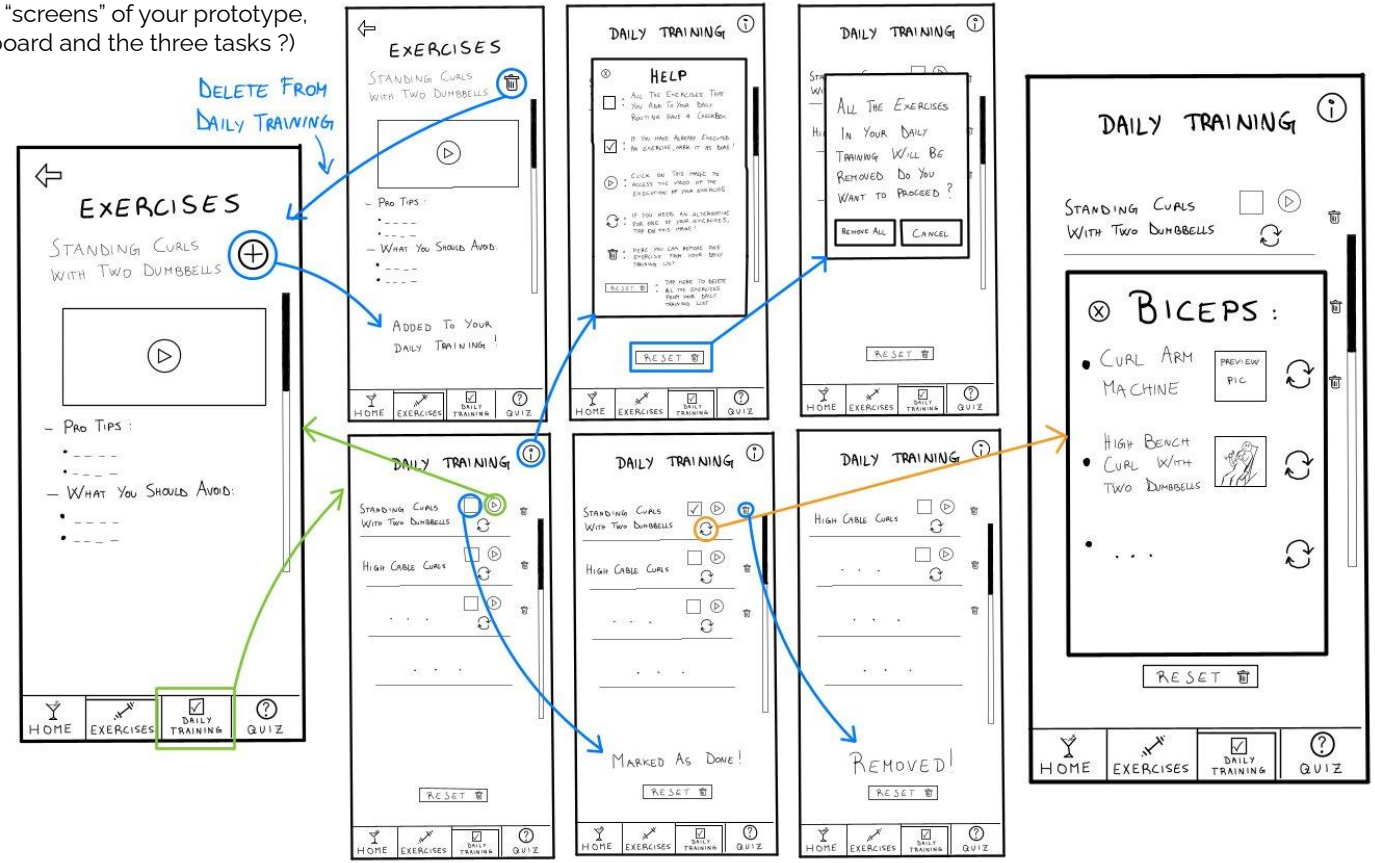


Paper prototype #1

(4.a Include the high-level flow of the "screens" of your prototype,
4.b How does it connect to the storyboard and the three tasks ?)

Simple task:
Starting from his "daily training", the user can access the exercise details by clicking on the "video" icon.

Moderate task:
The user has the option to change exercises from his "daily training" by clicking on the highlighted icon (yellow). A set of alternatives will be displayed in order to allow the user to choose

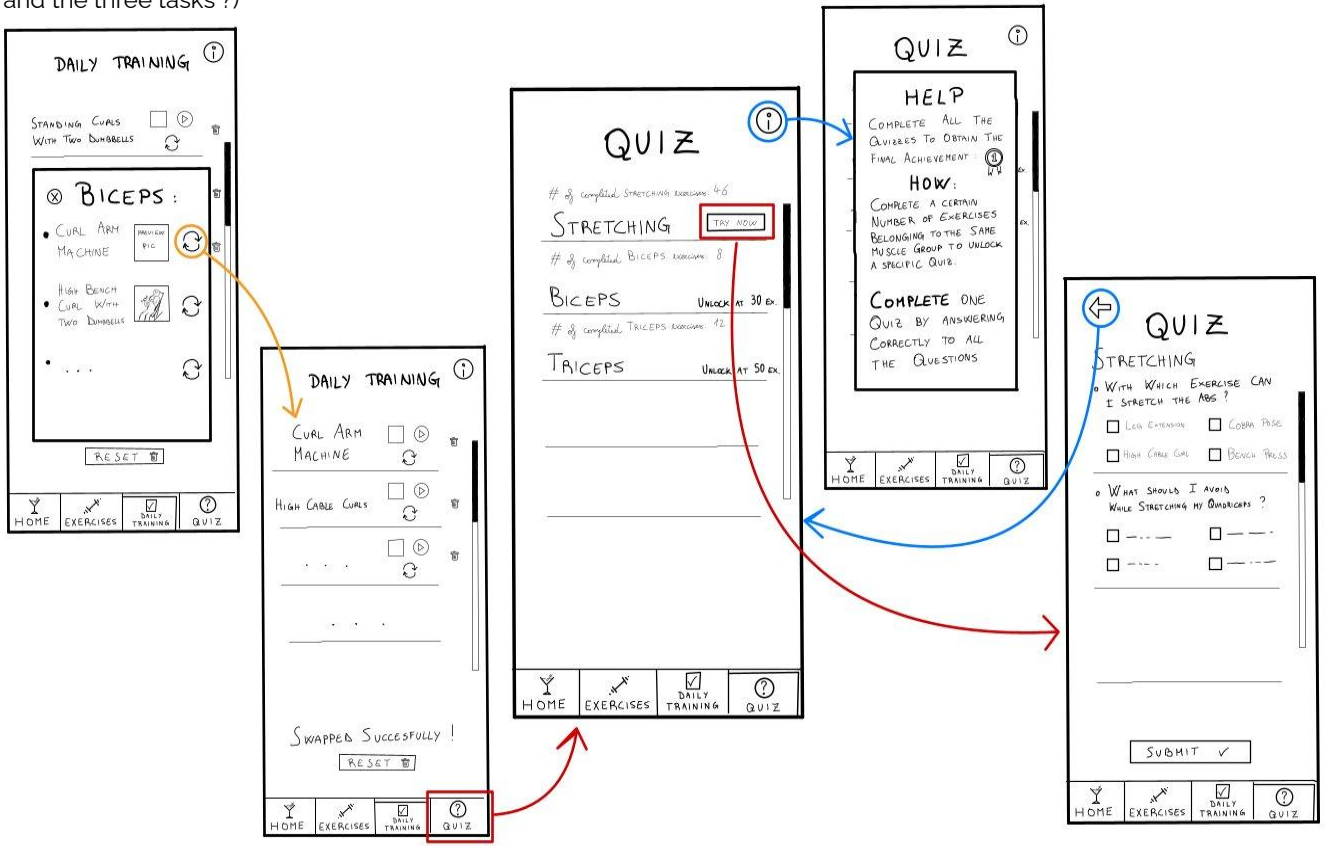


Paper prototype #1

(4.a Include the high-level flow of the "screens" of your prototype,
4.b How does it connect to the storyboard and the three tasks ?)

Moderate task:
The substitution of the exercise is displayed in the "Daily training" once the user has clicked on the specific icon (yellow).

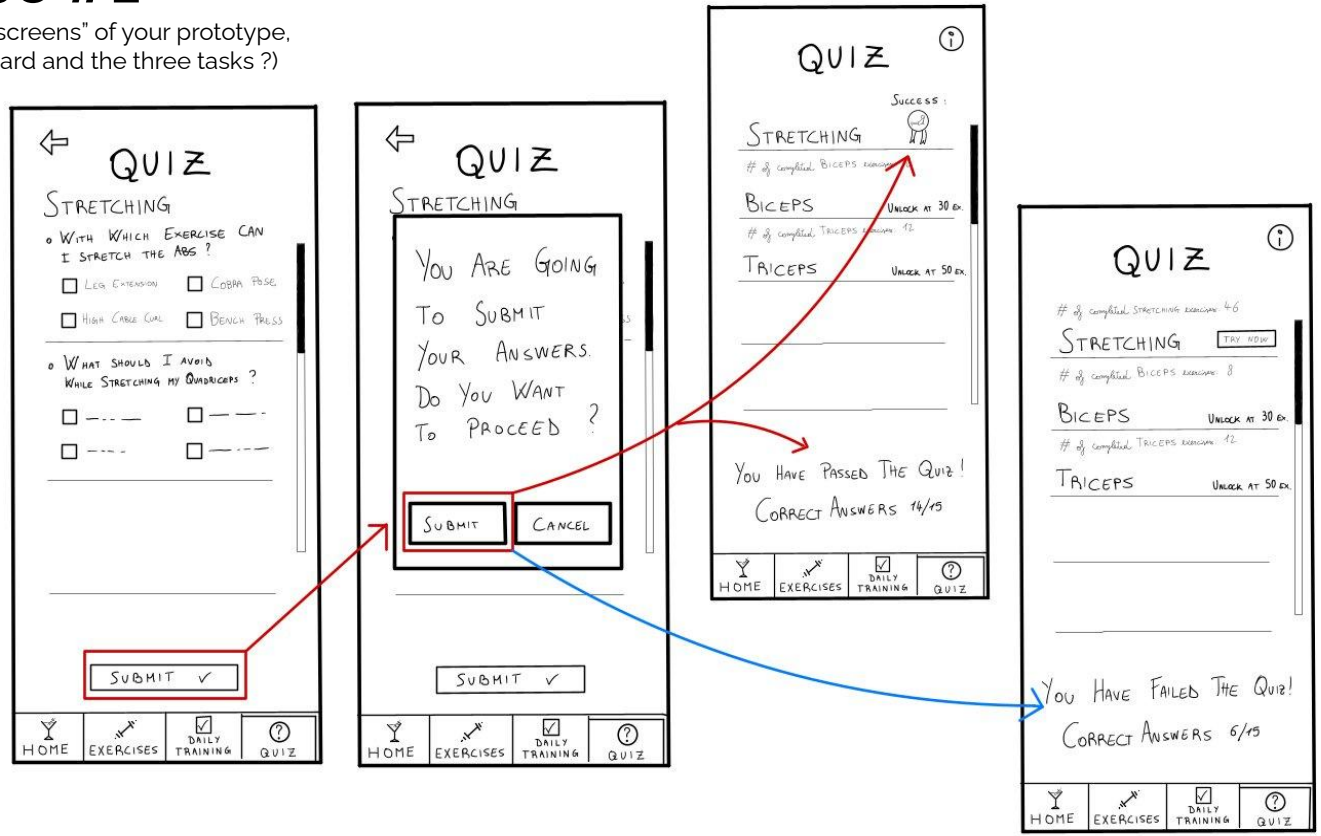
Complex task:
By accessing the "Quiz" tab, the user can obtain a certified level after completing correctly a quiz. A set of quizzes is available and the user can access them by completing a certain number of exercises related to the quiz itself.



Paper prototype #1

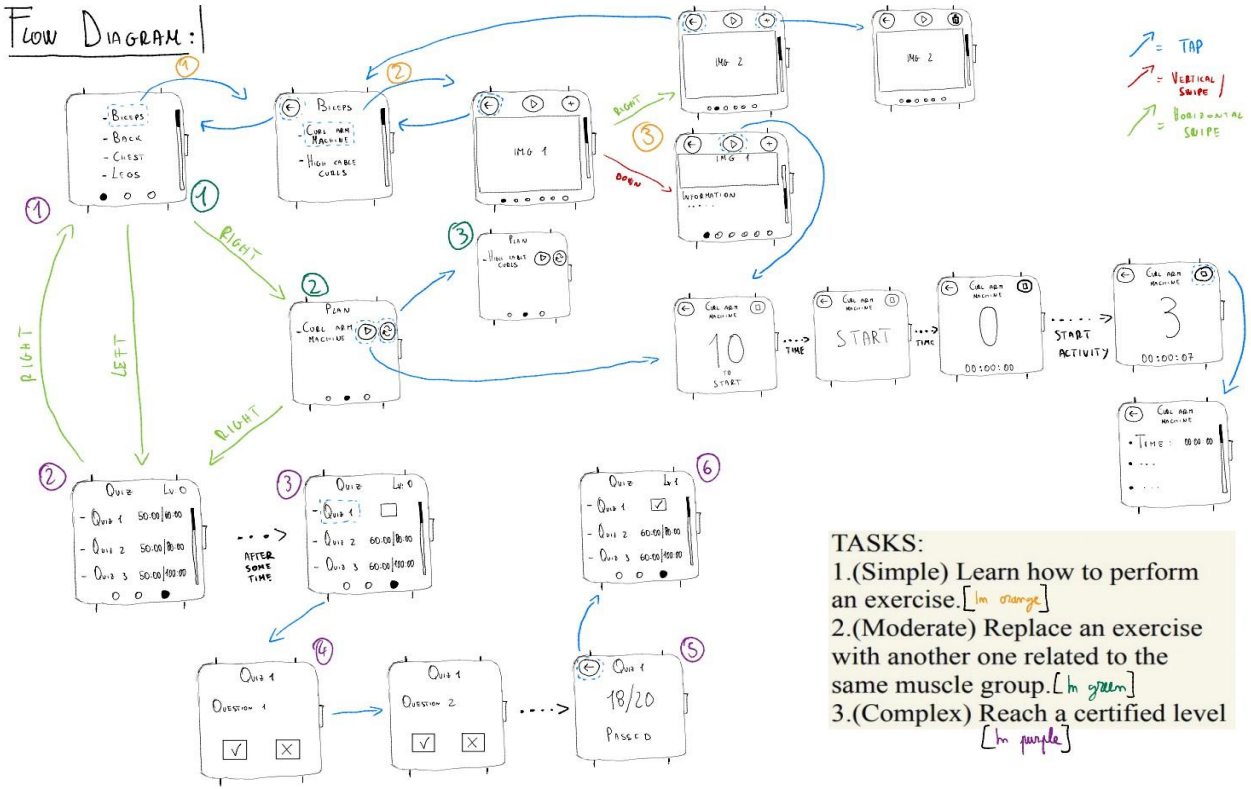
(4.a Include the high-level flow of the "screens" of your prototype,
4.b How does it connect to the storyboard and the three tasks ?)

Complex task:
Once the user has opened the quiz and submitted the answers, if he scores a certain number of points the quiz is considered as passed. An achievement is displayed on the screen in the "Quiz" tab.
If the user does not pass the quiz, a message of failure is displayed on the screen and he has the possibility to try again the same quiz.



Paper prototype #2

(5.a Include the high-level flow of the "screens" of your prototype,
5.b How does it connect to the storyboard and the three tasks ?)

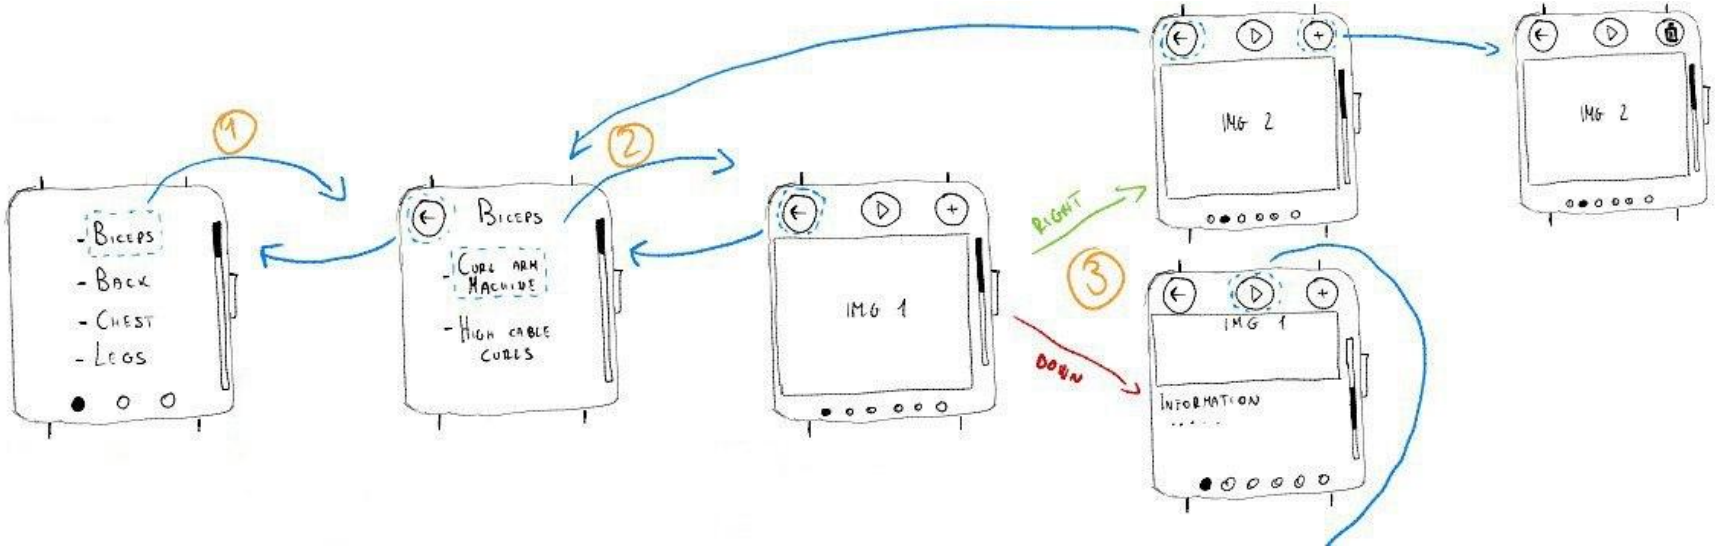


TASKS:
1.(Simple) Learn how to perform an exercise.[In orange]
2.(Moderate) Replace an exercise with another one related to the same muscle group.[In green]
3.(Complex) Reach a certified level [In purple]

Paper prototype #2

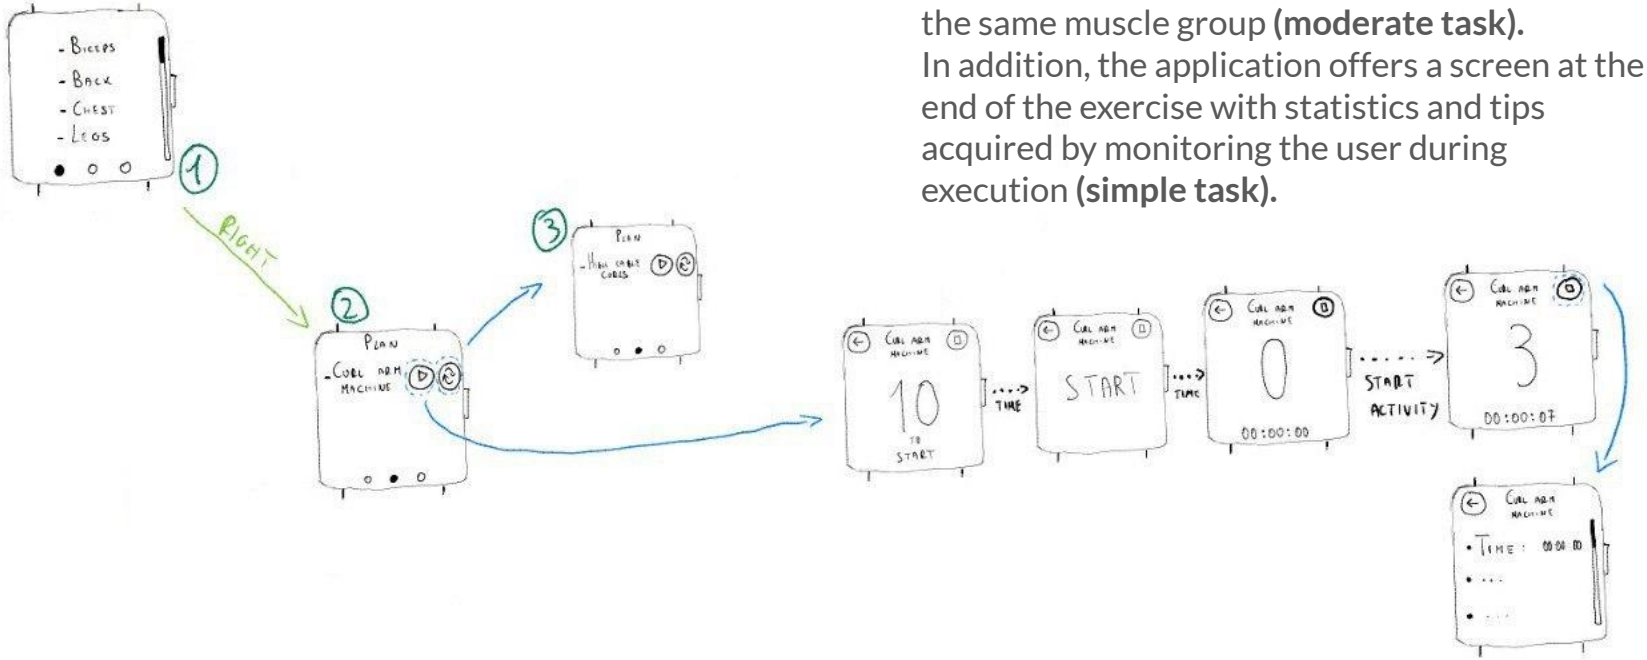
(5.a Include the high-level flow of the "screens" of your prototype,
5.b How does it connect to the storyboard and the three tasks ?)

The user can search for the specific exercise by muscle group and select it to find out through textual and visual information how to best perform the exercise **(simple task).**



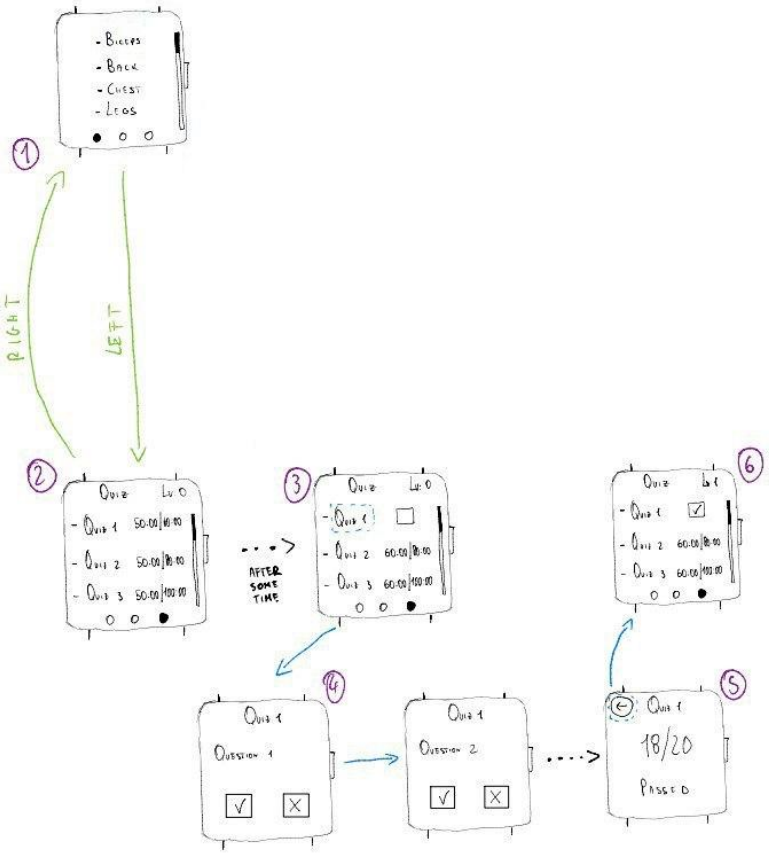
Paper prototype #2

(5.a Include the high-level flow of the “screens” of your prototype,
5.b How does it connect to the storyboard and the three tasks ?)



The user can change an exercise and it will automatically be replaced by an exercise from the same muscle group **(moderate task).**
In addition, the application offers a screen at the end of the exercise with statistics and tips acquired by monitoring the user during execution **(simple task).**

Paper prototype #2

(5.a Include the high-level flow of the “screens” of your prototype,
5.b How does it connect to the storyboard and the three tasks ?)


The user can take advantage of quizzes that are unlocked after a certain number of training hours. The user can then check his or her level and achieve the certificate **(complex task).**
